Introduction

Functional Programming Languages

- OCaml, F#, SML, Haskell, Clean

Evaluation Strategies

- **Call-by-value (cbv)**
 - Evaluate the argument first, then substitute
 - OCaml, F#, SML
- **Call-by-name (cbn) / lazy**
 - Substitute the argument, evaluate only when needed
 - Haskell, Clean

Example cbn and cbv

Let f be defined as

$$f(x) = x * x$$

Example cbn and cbv

Let f be defined as

$$f(x) = x * x$$

cbn and cbv evaluation of $f(3 + 3)$

Example cbn and cbv

Let f be defined as

$$f(x) = x * x$$

cbn and cbv evaluation of $f(3 + 3)$

cbn:

cvb:

Example cbn and cbv

Let f be defined as

$$f(x) = x * x$$

cbn and cbv evaluation of $f(3 + 3)$

cbn:

$$f(3 + 3) \rightarrow (3 + 3) * (3 + 3)$$

cvb:

$$f(3 + 3) \rightarrow f(6)$$

Example cbn and cbv

Let f be defined as

$$f(x) = x * x$$

cbn and cbv evaluation of $f(3 + 3)$

cbn:

$$\begin{aligned} f(3 + 3) &\rightarrow (3 + 3) * (3 + 3) \\ &\rightarrow 6 * (3 + 3) \end{aligned}$$

cvb:

$$\begin{aligned} f(3 + 3) &\rightarrow f(6) \\ &\rightarrow 6 * 6 \end{aligned}$$

Example cbn and cbv

Let f be defined as

$$f(x) = x * x$$

cbn and cbv evaluation of $f(3 + 3)$

cbn:

$$\begin{aligned} f(3 + 3) &\rightarrow (3 + 3) * (3 + 3) \\ &\rightarrow 6 * (3 + 3) \\ &\rightarrow 6 * 6 \end{aligned}$$

cvb:

$$\begin{aligned} f(3 + 3) &\rightarrow f(6) \\ &\rightarrow 6 * 6 \\ &\rightarrow 36 \end{aligned}$$

Example cbn and cbv

Let f be defined as

$$f(x) = x * x$$

cbn and cbv evaluation of $f(3 + 3)$

cbn:

$$\begin{aligned} f(3 + 3) &\rightarrow (3 + 3) * (3 + 3) \\ &\rightarrow 6 * (3 + 3) \\ &\rightarrow 6 * 6 \\ &\rightarrow 36 \end{aligned}$$

cvb:

$$\begin{aligned} f(3 + 3) &\rightarrow f(6) \\ &\rightarrow 6 * 6 \\ &\rightarrow 36 \end{aligned}$$

Reasons to Unify cbn and cbv

Pros/Conns of cbn and cbv

Sometimes arguments are used:

- **zero** times: **cbn** is more efficient
- **multiple** times: **cbv** is more efficient

Reasons to Unify cbn and cbv

Pros/Conns of cbn and cbv

Sometimes arguments are used:

- **zero** times: **cbn** is more efficient
- **multiple** times: **cbv** is more efficient

Reasons to Unify cbn and cbv

Pros/Conns of cbn and cbv

Sometimes arguments are used:

- **zero** times: **cbn** is more efficient
- **multiple** times: **cbv** is more efficient

Unification

- Best of both worlds
- Universal Framework

Thunks and CPS Translation

Wrappers around expressions to delay evaluation

Continuous Passing Style translation

Thunks and CPS Translation

- Wrappers around expressions to delay evaluation

- Continuous Passing Style translation

Linear Logic

- Explicit control over resources

- Arguments correspond to resources

Thunks and CPS Translation

- Wrappers around expressions to delay evaluation

- Continuous Passing Style translation

Linear Logic

- Explicit control over resources

- Arguments correspond to resources

Modal Logic

- Adds box modality

- Boxed terms are treated as values

A formalisation of the unification of call-by-name and call-by-value using modal logic

Background

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$$

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$$

Example terms

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$$

Example terms

x

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$$

Example terms

x

$\lambda x.x$

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$$

Example terms

x

$\lambda x.x$

$\lambda y.yz$

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$$

Example terms

x

$\lambda x.x$

$\lambda y.yz$

$(\lambda y.y)z$

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$

Example terms

x

$\lambda x.x$

$\lambda y.yz$

$(\lambda y.y)z$

$\lambda x.\lambda t.xt(\lambda s.w)wy$

X

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$$

Example terms

x

$\lambda x.x$

$\lambda y.yz$

$(\lambda y.y)z$

$\lambda x.\lambda t.xt(\lambda s.w)wy$

X

$X \rightarrow X$

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$

Example terms

x

$\lambda x.x$

$\lambda y.yz$

$(\lambda y.y)z$

$\lambda x.\lambda t.xt(\lambda s.w)wy$

X

$X \rightarrow X$

$(X \rightarrow X) \rightarrow X$

Grammar Lambda Calculus (λ -calculus)

λ -terms and Types

$$M, N, P, Q ::= x \mid \lambda x.M \mid MN \quad A ::= X \mid A \rightarrow A'$$

Example terms

x

$\lambda x.x$

$\lambda y.yz$

$(\lambda y.y)z$

$\lambda x.\lambda t.xt(\lambda s.w)wy$

X

$X \rightarrow X$

$(X \rightarrow X) \rightarrow X$

$(X \rightarrow X) \rightarrow (X \rightarrow X)$

Call-by-name evaluation λ -calculus

β -reduction

$$(\lambda x.M)N \rightarrow M[x \mapsto N] \quad (\beta_n)$$

Closure rule

$$\frac{M \rightarrow M'}{MN \rightarrow M'N} \quad (\mu)$$

cbn evaluation

β -reduction together with the μ closure rule

Call-by-box λ -calculus

λ -terms

$$M, N, P, Q ::= \varepsilon(x) \mid \lambda x.M \mid MN \mid \text{box}(N)$$

Idea

- ε : unbox operator
- box : box operator
- parameters of abstractions are boxed

Types

$$A ::= X \mid B \rightarrow A \mid B \qquad B ::= \Box A$$

Call-by-box evaluation

β -reduction

$$(\lambda x.M)\text{box}(N) \rightarrow M[\varepsilon(x) \mapsto N] \quad (\beta_b)$$

Closure rules

$$\frac{M \rightarrow M'}{MN \rightarrow M'N} (\mu)$$

$$\frac{N \rightarrow N'}{MN \rightarrow MN'} (\nu)$$

cbb evaluation

β -reduction together with the μ and ν closure rule

Embeddings into λ_b

Girard's and Gödel's Translation

- Translate standard λ -calculus into λ_b
- **Girard's** translation: λ_n into λ_b
- **Gödel's** translation: λ_v into λ_b
- Call-by-box evaluation simulates
 - **cbn** under **Girard's** embedding
 - **cbv** under **Gödel's** embedding
- Notation: M° is the Girard translation of λ -term M
- Main propositions

Translation from cbn λ -terms to λ_b

$$\begin{aligned} X^\circ &= X & x^\circ &= \varepsilon(x) \\ (A_1 \rightarrow A_2)^\circ &= \Box A_1^\circ \rightarrow A_2^\circ & (\lambda x.M)^\circ &= \lambda x.M^\circ \\ & & (MN)^\circ &= M^\circ \text{box}(N^\circ) \end{aligned}$$

Embedding of $(\lambda x.x)y$

$$\begin{aligned} ((\lambda x.x)y)^\circ &= (\lambda x.x)^\circ \text{box}(y^\circ) \\ &= (\lambda x.x^\circ) \text{box}(\varepsilon(y)) \\ &= (\lambda x.\varepsilon(x)) \text{box}(\varepsilon(y)) \end{aligned}$$

Well-typed terms after translation

$$M, N ::= \varepsilon(x) \mid \lambda x.M \mid M_{\text{box}}(N)$$

- Eliminates the ν closure rule
- Only the μ rule remains
- Call-by-box becomes **deterministic**
- If M evaluates to N with cbb, then M° evaluates to N° with cbb

Agda

What is Agda?

Functional programming language

What is Agda?

Functional programming language

Inspired by Haskell

Dependently typed

Hole-based programming

Girard's Embedding for Types

$$(A_1 \rightarrow A_2)^\circ = \Box A_1^\circ \rightarrow A_2^\circ$$
$$X^\circ = X$$

Embedding in Agda

```
embedType : Type → Typeb
embedType (C ⇒ D) = □ (embedType C) ⇒b embedType D
embedType X = X
```

Challenges

- Variables
 - Use of de Bruijn indices
 - Variables represented as natural numbers
- Ill-typed terms
 - λ -term $y(\lambda x.x)$ is not typeable
 - Solution: restrict to well-typed λ -terms
- Formal definition of substitution
- Formal definition of raise in Gödel's translation

Experience Working with Agda

- Interesting learning experience
- High learning curve
- Hole based programming is amazing
- Error messages are not always helpful
- But give it a try!
 - Follow the online PLFA book (Programming Language Foundations in Agda)
 - <https://plfa.github.io/>

Conslusions

Conclusion

- Recap of the λ -calculus
- Explained λ_b
- Defined the unifying relation cbb
- Girard's translation
- Formally proved the main properties of the translations
